

Airflow 2.0 on Amazon MWAA

Airflow Summit 2021

Sam Dengler and John Jackson

July 15th, 2021

Table of contents

- How Amazon MWAA does Apache Airflow
- Staying current 2.x and beyond
 - Upgrades and new Apache Airflow version support
- Staying Open and contributing
 - AWS Contributions to Date
 - Support Plan for the Open Source Community

How Amazon MWAA does Apache Airflow

Amazon Managed Workflows for Apache Airflow (MWAA)

- A managed service for Apache Airflow that makes it easy for data engineers and data scientists to execute data processing workflows on AWS
- Released November 24, 2020, added Airflow 2.0 support May 26, 2021

Amazon MWAA is Open Source Apache Airflow: No Forks

Amazon MWAA Architecture

How Amazon MWAA Helps

- Deployments and Operations
 - Easy to setup up and maintain
- Availability and Sizing
 - Multi AZ/HA with Airflow 2.0 on ECS Fargate
- Scaling
 - Auto scaling with Celery executor
- Security
 - IAM and VPC

Setup

Upgrades

Scaling

Security

Maintenance

Deployments and Operations

- Easy to set up multiple small environments
- Prod/Dev environments
- CloudWatch
 - Logging
 - Metrics/Alarms
 - Dashboards
- CloudFormation/Terraform
 - Configure User Access, Environment (Execution Role) access, and Airflow Configurations without accessing the UI

Scaling/Environment Sizes

- Using Airflow metrics
- $(\text{Tasks running} + \text{tasks queued}) / \text{tasks per container} = \text{number of containers required}$
- Downscaling occurs when $(\text{Tasks running} + \text{tasks queued}) = 0$

Environment class Info	
Class	Maximum worker count
mw1.small	10
Scheduler count	Minimum worker count
2	1

Security with MWAA

- Auth (IAM/Federation)
- VPC/SG
- Secrets Manager
- Execution Role

CI/CD

- Versioned S3 Bucket deployment target
- Flexible integration with existing CI/CD pipelines
- DAGs automatically synchronized every 30-60s
- Custom Plugin and Python dependency changes require Environment update

Create an MWAA
Environment

Copy your DAGs
and Plugins to S3

Access the Airflow
UI

Amazon MWAA Best Practices

Configuration and Migration

Best Practices – Creating the Environment

- VPC Network
 - Connectivity to AWS Services
 - Private Web Server Option
- IAM Execution Role
 - Access to AWS Services
 - AOK vs CMK
- Python Requirements
 - Compatible Versions
 - Debugging
- Configuration Overrides
 - Performance Tuning
 - Secrets Backend Support

Environment details [Info](#)

Name

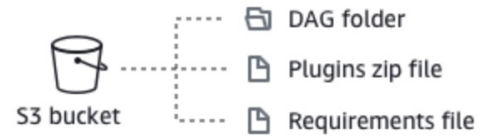

Use only letters, numbers, dashes, or underscores. Max 80 characters.

Airflow version

2.0.2 (Latest) ▼

DAG code in Amazon S3 [Info](#)

Amazon MWAA uses your Amazon S3 bucket to load your DAGs and supporting files. Specify your S3 bucket, and the paths of your DAG folder, plugins.zip, and requirements.txt.

S3 bucket

- DAG folder
- Plugins zip file
- Requirements file

i Create or specify an S3 bucket to store your DAG code. The bucket name must have versioning enabled. You can create a new bucket in the [Amazon S3 console](#).

S3 Bucket

The S3 bucket where your source code is stored. Enter an S3 URI or browse and select a bucket.

View ↗

Browse S3

Format: s3://mybucketname

Best Practices – Migration

- Moving tasks off the Worker that require
 - Local Docker
 - Custom runtimes
 - Large CPU/Memory
 - Sudo
- Assume Ephemeral Workers
 - Limited Bash Value
 - Local storage between tasks
- Web Server Restrictions
 - Not currently installing requirements.txt or plugins

Contributions and Staying Current

Staying Current

- Target is to provide minor versions on Amazon MWAA within 30 days of Apache Airflow community release
 - We're not there yet, but we're working on it
- Major releases will take a bit longer
- We'll keep older versions (i.e. 1.10.x) available for as long as we can
 - Depends on security, stability, and customer demand
- Version status will be posted at <https://docs.aws.amazon.com/mwaa/latest/userguide/airflow-versions.html>

Open Source Contributions

- EKS Native operator
- Improved Apache Airflow AWS integrations
- Performance and security improvements
- Native Serverless executor

```
def __init__(self, datadir, ndims):
    idfile = os.path.join(datadir, "id.txt")
    self.names = [x.strip() for x in str.split(open(idfile).read()) if x.strip()]
    self.name2index = dict(zip(self.names, range(len(self.names))))
    self.ndims = ndims
    self.featurefile = os.path.join(datadir, "feature.bin")
    print "[BigFile] %d features, %d dimensions" % (len(self.names), self.ndims)
    print "        binary: %s" % self.featurefile
    print "        txt: %s" % idfile

def read(self, requested, isname=True):
    if isname:
        index_name_array = [(self.name2index[x], x) for x in requested if x in self.names]
    else:
        assert(min(requested) >= 0)
        assert(max(requested) < len(self.names))
        index_name_array = [(x, self.names[x]) for x in requested]
        index_name_array.sort()

    vecs = seq_read(self.featurefile, self.ndims, [x[0] for x in index_name_array])
    return [x[1] for x in index_name_array], vecs

def shape(self):
    return [len(self.names), self.ndims]

class MemoryFile(SimpleMemoryFile):
    def
