& Contribution

# Nielsen Identity Engine

- eXelate was acquired by Nielsen on March 2015
- A Data company
- Machine learning models for insights
- Targeting
- Business decisions

# Nielsen Identity Engine in numbers

**~3000 nodes/day**

**\$100K's/month**

**~30TB ingested/day**

**10's of TB  
ingested/day**

# The challenges

Scalability

Fault-tolerance

Cost Efficiency

# Why did we need Airflow?

- Dozens of ETL workflows running around the clock
- Originally used AWS Data Pipeline for workflow management
- But we also wanted:
  - Better **visibility** of configuration and workflow
  - Better **monitoring** and **statistics**
  - Share **common configuration/code** between workflows

# Why do we ❤️ Airflow?

Met all requirements & more

~2 years in production

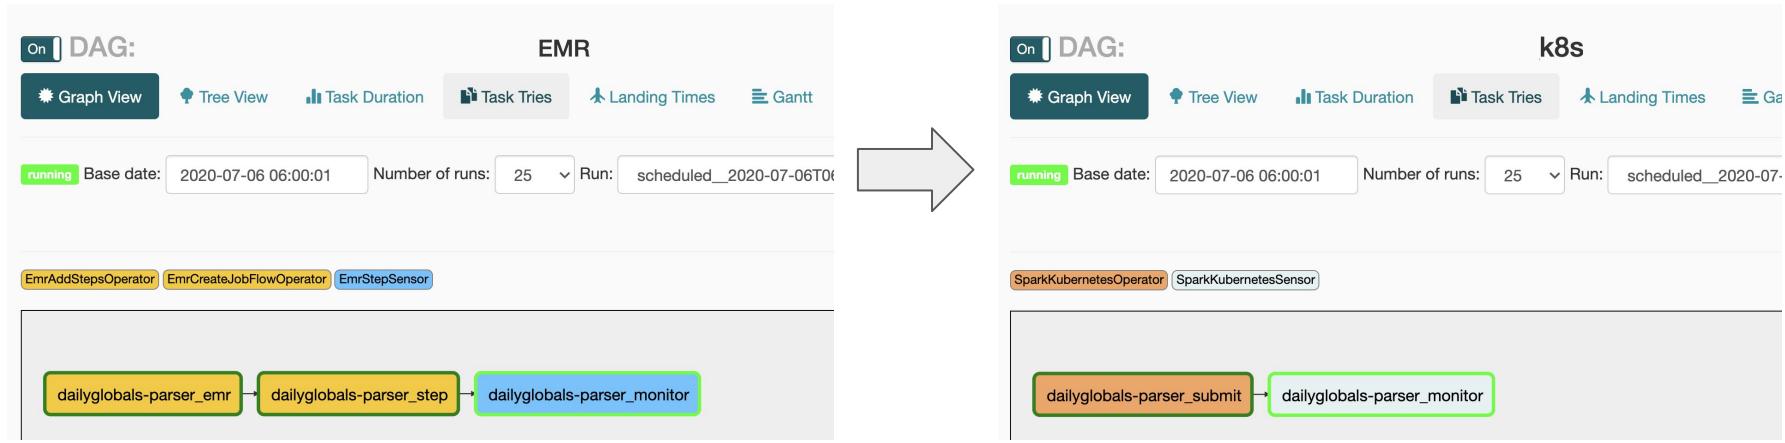

~40 users across 4 groups

~1000 DAG Runs/day

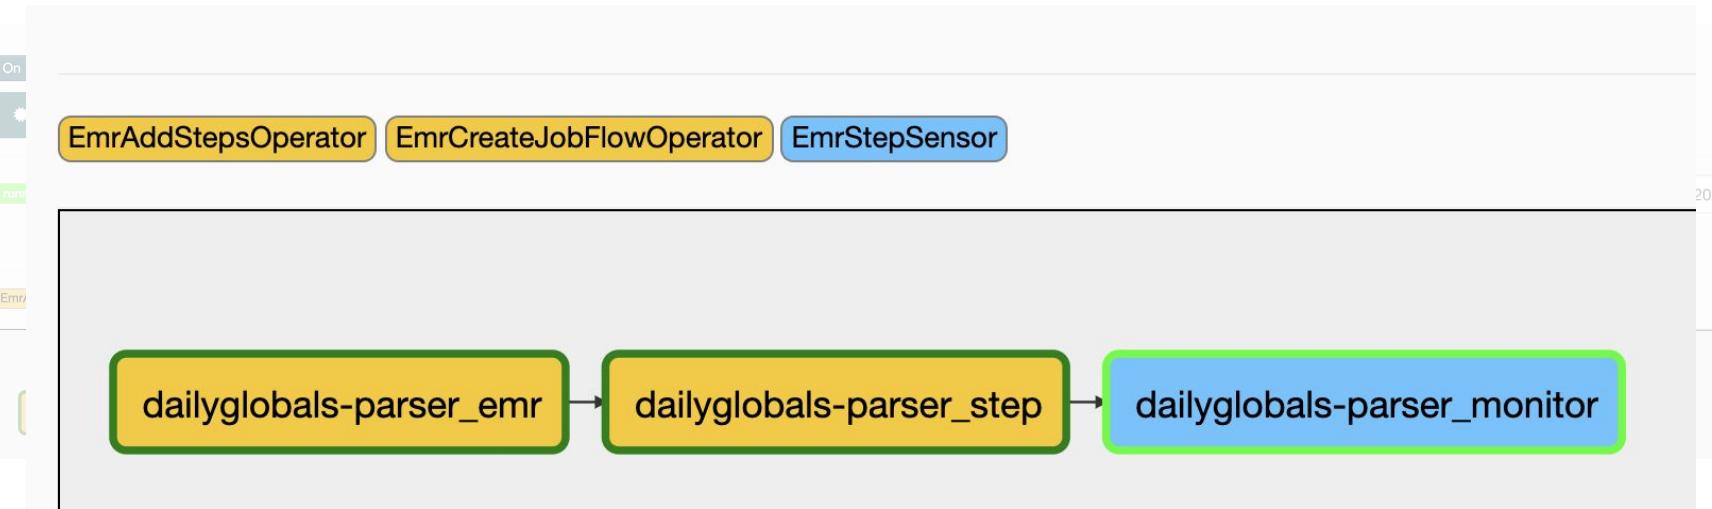

~20 automatic DAG deployments/day

6 contributions to open-source

# What is Spark?

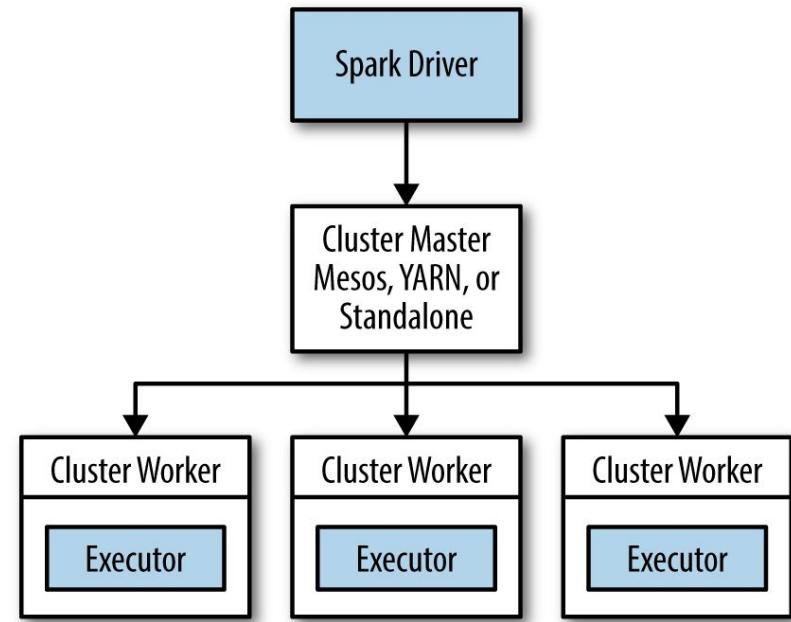

- An analytics engine for large-scale **data processing**
- **Distributed** and highly **scalable**
- A **unified framework** for batch, streaming, machine learning, etc.

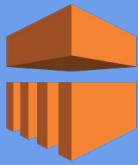

# Basic Spark terminology

- Driver
- Executor
- Cluster manager
  - Mesos, YARN or Standalone
- Managed Spark on public clouds
  - AWS EMR, GCP Dataproc, etc.

# What is EMR?

EMR is an AWS managed service to run Hadoop & Spark clusters

Allows you to reduce costs by using Spot instances

Charges management cost for each instance in a cluster

# Running Airflow-based Spark jobs on EMR

- EMR has official Airflow support

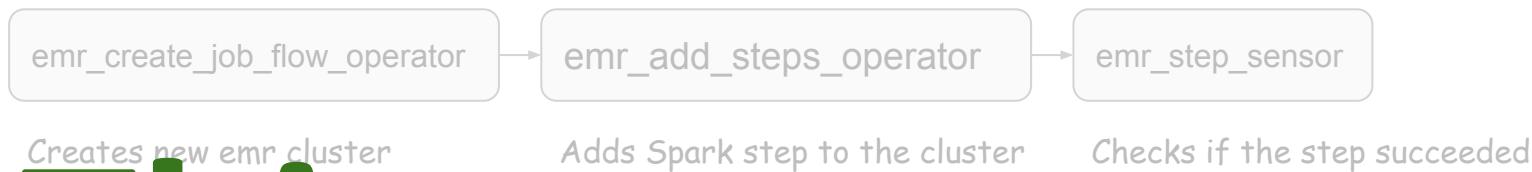

- Open-source, remember?

- Allows us to **fix** existing components
  - EmrStepSensor fixes ([AIRFLOW-3297](#))
- ... As well as add **new** components
  - AWS Athena Sensor ([AIRFLOW-3403](#))
  - OpenFaaS hook ([AIRFLOW-3411](#))

# Running Airflow-based Spark jobs on EMR

- EMR has official Airflow support

- Open source, community driven?

- Allows us to **fix** existing components

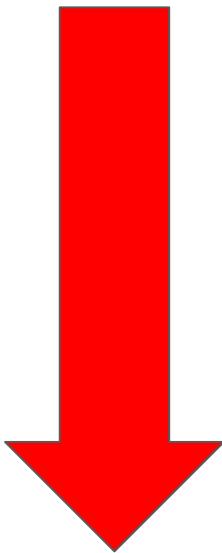

- EmrStepSensor fixes ([AIRFLOW-3297](#))

- ... As well as add **new** components
- AWS Athena Sensor ([AIRFLOW-3403](#))
      - OpenFaaS hook ([AIRFLOW-3411](#))

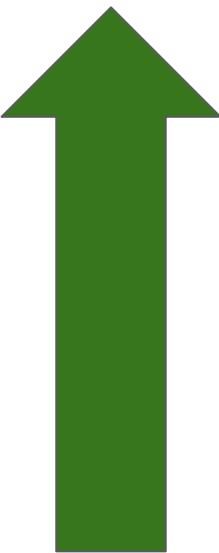

# This was great...

# But we wanted MORE!

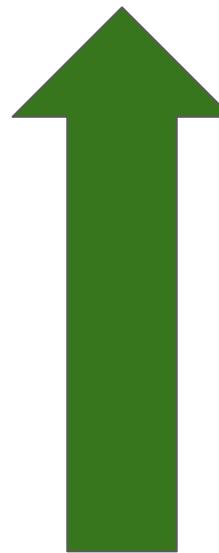

\$\$\$

Visibility

Robustness

# Introducing - Spark-on-Kubernetes

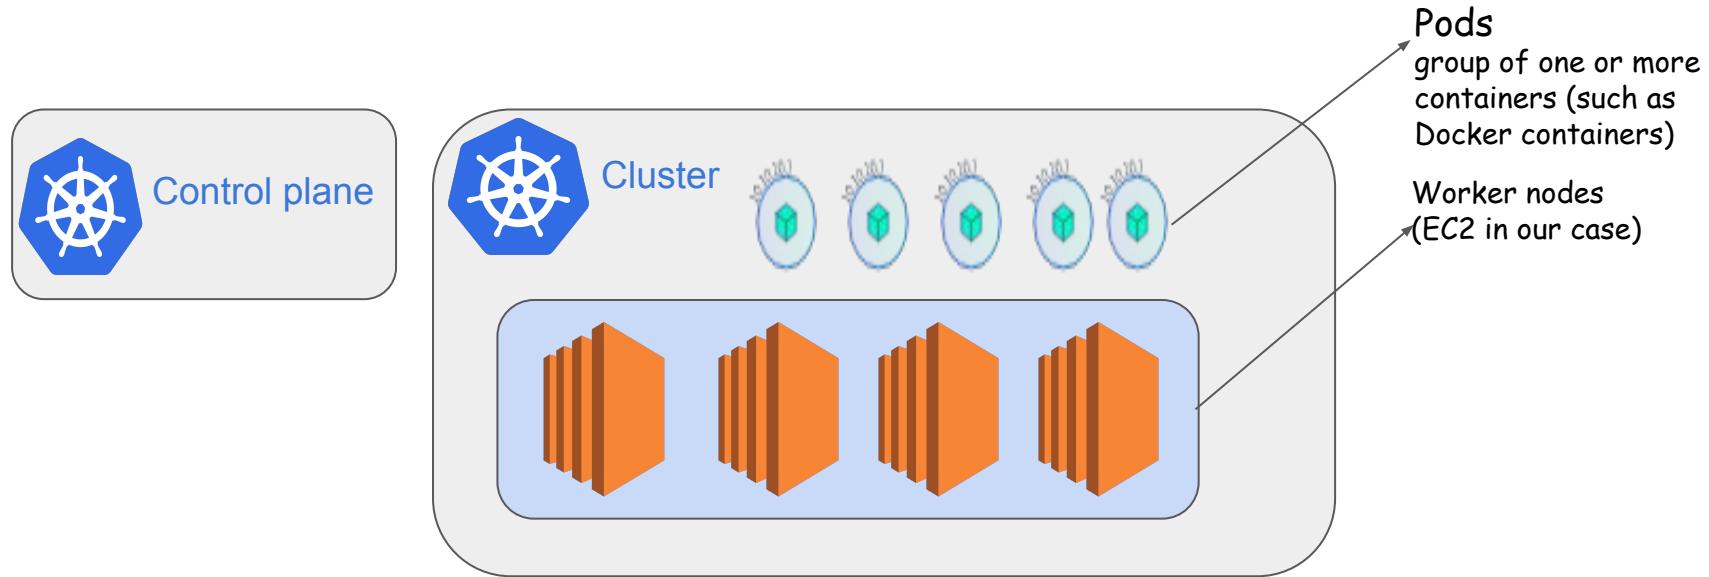

# Let's explain what is Kubernetes (a.k.a K8s)

- Open source platform for running and managing **containerized workloads**
- Includes
  - **Built-in controllers** to support various workloads (e.g micro-services)
  - **Additional extensions** (called “**operators**”) to support custom workloads
- Highly scalable

# Basic Kubernetes terminology

# Basic Kubernetes terminology

- **kubectl** - K8s CLI

```
(base) ➔ ~ kubectl get po  
NAME                 READY   STATUS    RESTARTS   AGE  
app1-67d75d7f9-bj8fh   1/1     Running   0          11s
```

```
(base) ➔ ~ kubectl run ubuntu --image ubuntu:18.06 --generator=run-pod/v1  
pod/ubuntu created
```

# Basic Kubernetes terminology

- The term “operator” exists both in Airflow and in Kubernetes

# Basic Kubernetes terminology

- The term “operator” exists both in Airflow and in Kubernetes
-  operator
  - Represents a **single task**
  - Operators determine what is actually executed when your DAG runs
  - Example:
    - **bash-operator** - executes a bash command

# Basic Kubernetes terminology

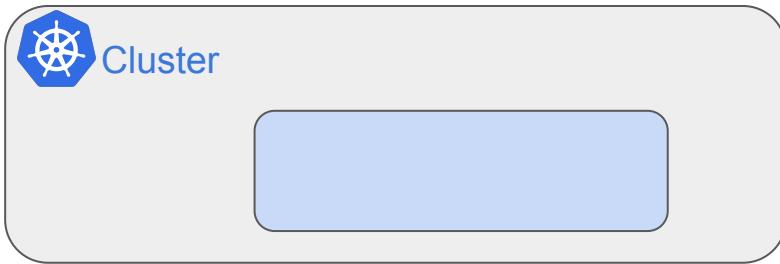

- The term “operator” exists both in Airflow and in Kubernetes
-  operator
  - Additional extensions to Kubernetes
  - Holds the knowledge of how to manage a **specific application**
  - Example:
    - **postgres-operator** - defines and manages a PostgreSQL cluster

# Basic Kubernetes terminology

- The term “operator” exists both in Airflow and in Kubernetes
-  operator
  - A more Kubernetes controller
  - Holds the knowledge of how to manage a **specific application**
  - Example:
    - **postgres-operator** - defines and manages a PostgreSQL cluster

# Kubernetes auto-scale

Phase 1: no applications are running on the cluster

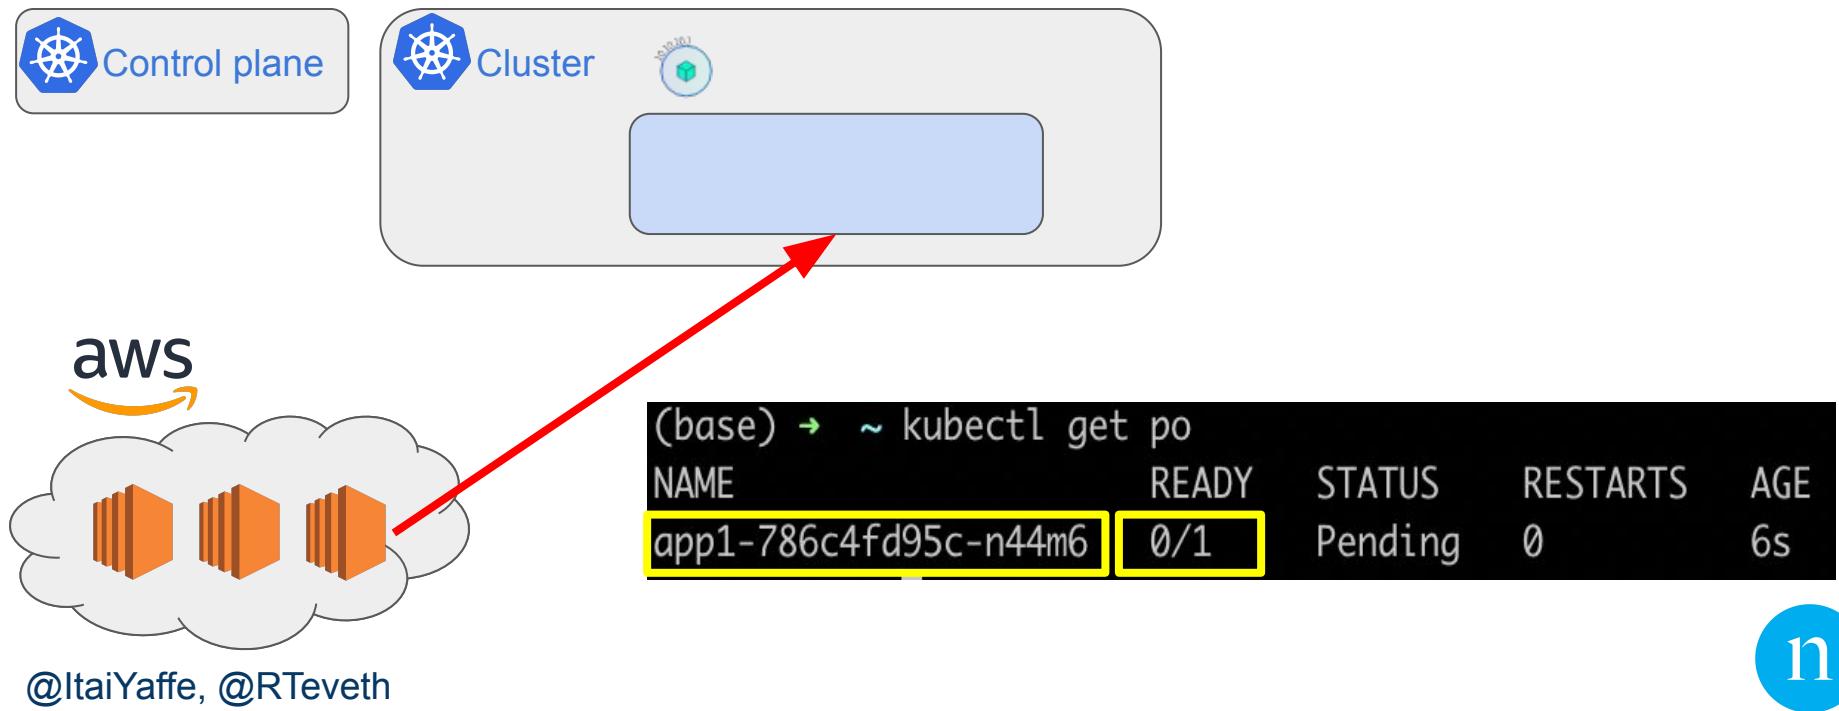

@ItaiYaffe, @RTeveth

```
(base) ➔ ~ kubectl get pods  
No resources found in default namespace.
```

# Kubernetes auto-scale

Phase 2: application #1 starts running

# Kubernetes auto-scale

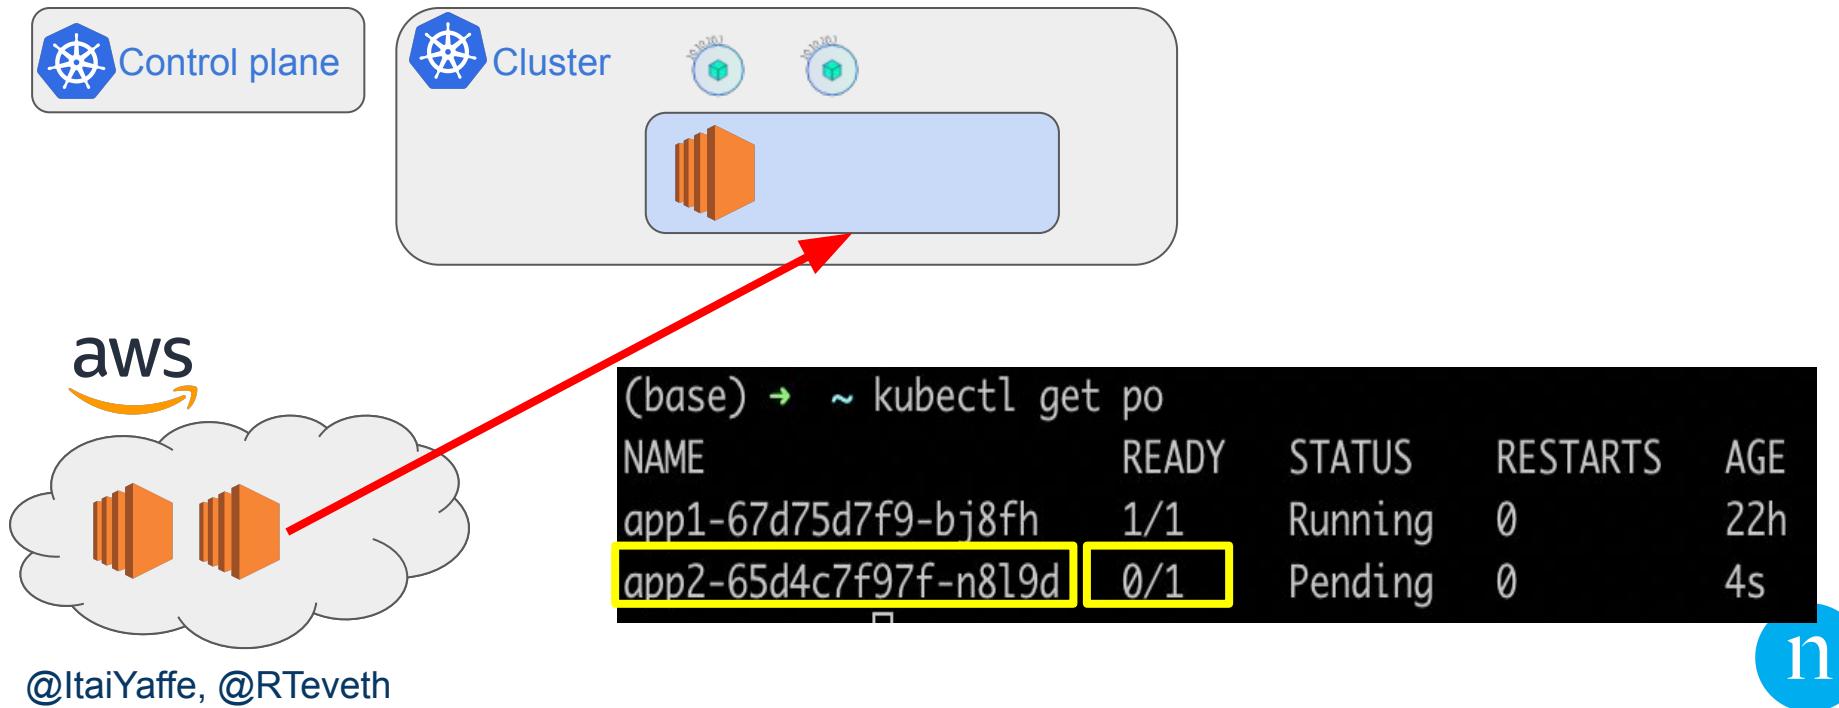

Phase 3: the cluster scales-up as needed

(base) → ~ kubectl get po					
NAME	READY	STATUS	RESTARTS	AGE	
app1-67d75d7f9-bj8fh	1/1	Running	0	11s	

# Kubernetes auto-scale

Phase 4: application #2 starts running

# Kubernetes auto-scale

Phase 5: the cluster scales-up as needed

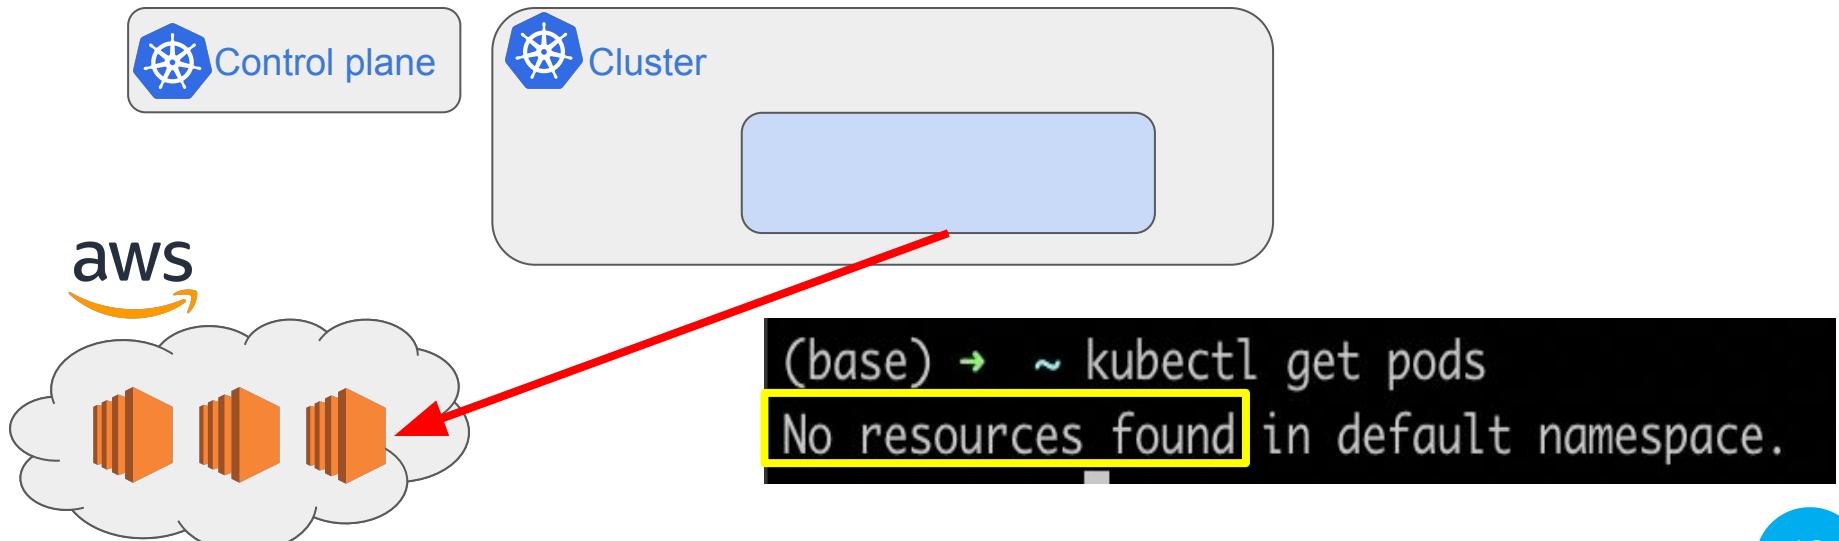

```
(base) ➔ ~ kubectl get po
```

NAME	READY	STATUS	RESTARTS	AGE
app1-6589f85558-w8pdm	1/1	Running	0	12s
app2-5499955bb4-pplgl	1/1	Running	0	7s

# Kubernetes auto-scale

Phase 6: applications finished running, cluster scales down

# Kubernetes in a nutshell

- A platform for running and managing **containerized workloads**
- Each cluster has
  - 1 control plane
  - 0..X worker nodes
  - 0..Y pods
  - 0..Z applications running concurrently
- Kubernetes operator != Airflow operator
- Automatically scales out and in

# Cool, so... Back to Spark-on-Kubernetes?

# Spark-On-Kubernetes overview

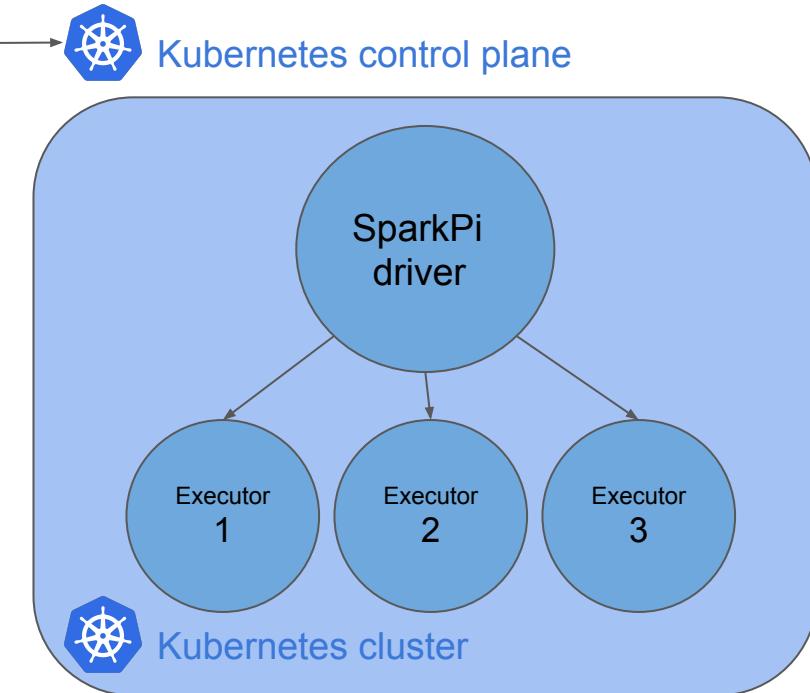

- From Spark 2.3.0, K8s is supported as a **cluster manager**
- This is still **experimental**, and some features are missing
  - Better auto-scaling is expected in future Spark releases (e.g through dynamic allocation)

# Submitting a Spark application to Kubernetes - alternatives

1. Using `spark-submit` script
2. Using Spark-On-Kubernetes Operator

# Spark-submit example - SparkPi

```
./bin/spark-submit \  
  --master  
  k8s://https://<k8s-apiserver-host>:<k8s-apiserver-port> \  
  --deploy-mode cluster \  
  --name spark-pi \  
  --class org.apache.spark.examples.SparkPi \  
  --conf spark.executor.instances=3 \  
  --conf spark.kubernetes.container.image=<spark-image>  
  
  local:///path/to/examples.jar
```

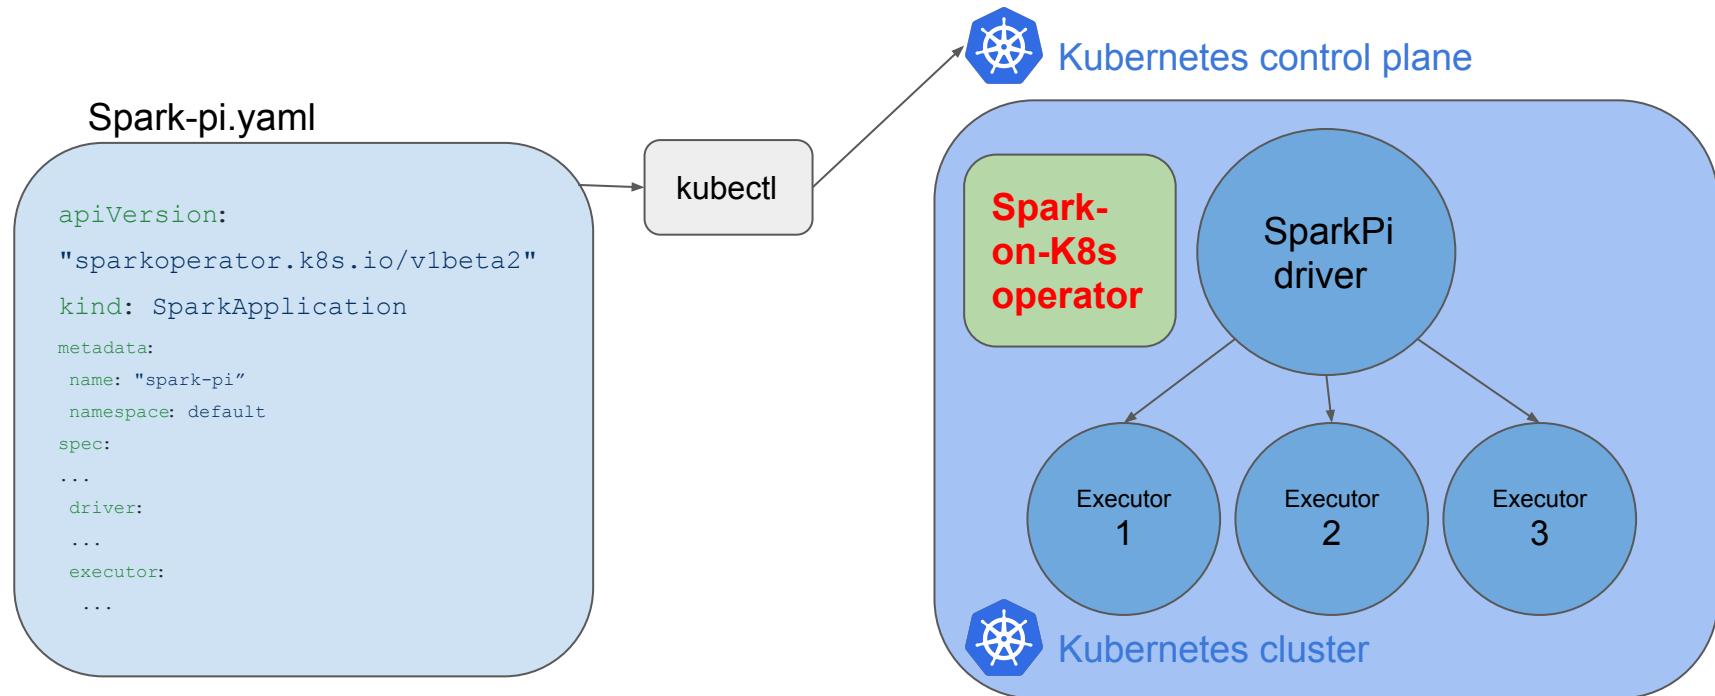

# Spark-On-Kubernetes operator

- A Kubernetes operator
- Extends Kubernetes API to support Spark applications
- Built by GCP as an open-source project

<https://github.com/GoogleCloudPlatform/spark-on-k8s-operator>

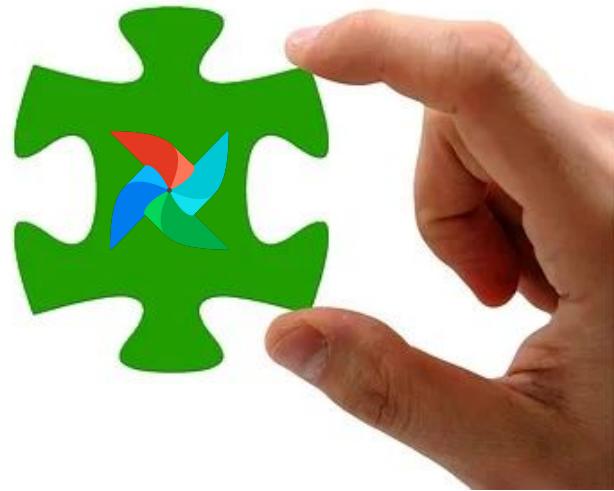

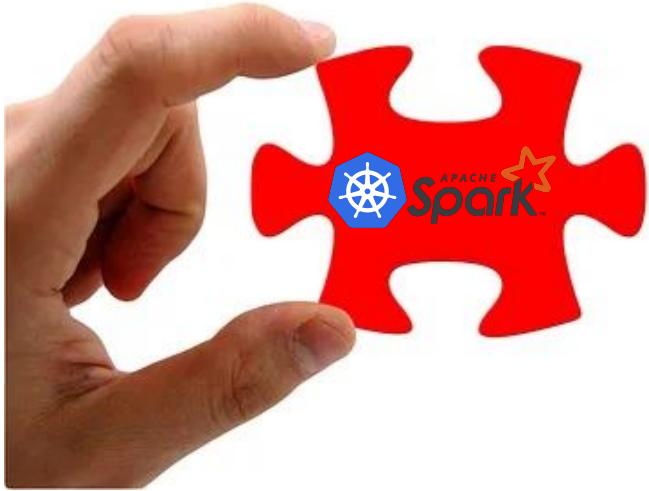

# Spark-On-Kubernetes operator example - SparkPi

# Submitting a Spark application to K8s

Topic	Spark-submit	Spark-On-K8s operator
Airflow built-in integration	V	X
Customize Spark-pods	X	V
Easy access to Spark UI	X	V
Submit and view application from kubectl	X	V

# Integrate it with Airflow

# So... we decided to take the road less traveled

[AIRFLOW-6542] add spark-on-k8s operator/hook/sensor #7163

Merged kaxil merged 1 commit into apache:master from roitvt:master on Mar 10

Conversation 125 Commits 1 Checks 2 Files changed 24 +1,505 -5

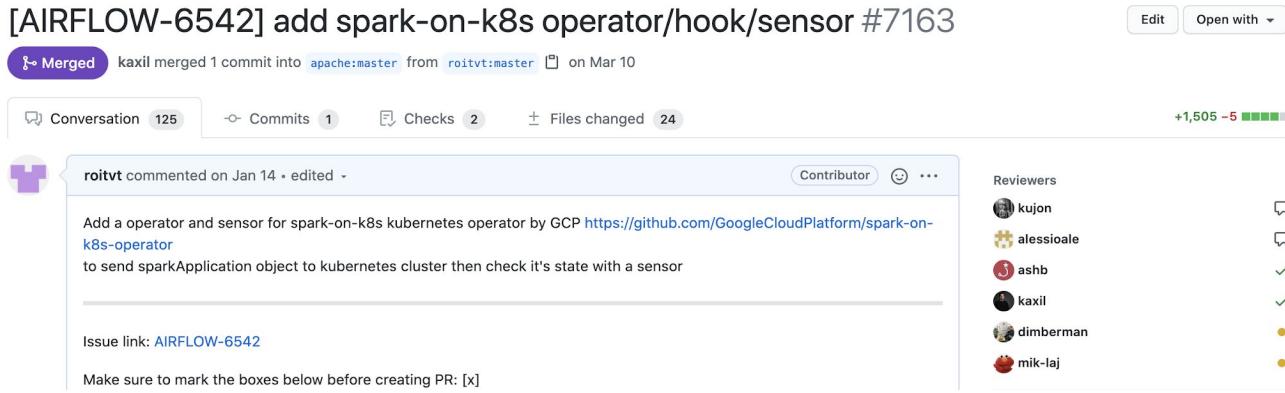

roitvt commented on Jan 14 • edited Add a operator and sensor for spark-on-k8s kubernetes operator by GCP <https://github.com/GoogleCloudPlatform/spark-on-k8s-operator> to send sparkApplication object to kubernetes cluster then check it's state with a sensor

# A special thanks to Airflow committers

[AIRFLOW-6542] add spark-on-k8s operator/hook/sensor #7163

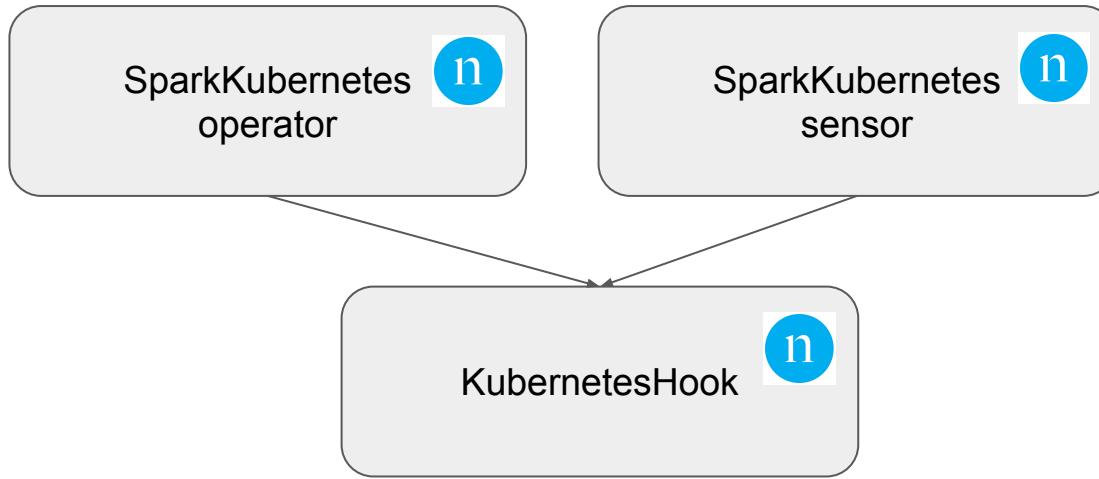

Merged kaxil merged 1 commit into apache:master from roitvt:master on Mar 10

The screenshot shows a GitHub pull request page for issue [AIRFLOW-6542]. The title is "add spark-on-k8s operator/hook/sensor". The pull request has been merged by kaxil into the apache:master branch from roitvt:master on March 10. The PR has 125 conversations, 1 file added, 2 changes, and 1,505 lines of code changed. The author is @CzerwonyElmo (Kamil Breguła). Reviewers include kujon, alessioale, ashb, kaxil, dimberman, and mik-laj. Assignees are listed as "No one assigned". Labels include area:Webserver, area:dev, and area:docs. Projects are listed as "None yet". Milestones are listed as "No milestone". The PR has 5 thumbs up and 1 star. A note at the bottom states: "In case of fundamental code change, Airflow Improvement Proposal (AIP) is needed. In case of a new dependency, check compliance with the ASF 3rd Party License Policy. In case of backwards incompatible changes please leave a note in UPDATING.md. Read the Pull Request Guidelines for more information."

# Airflow SparkKubernetes integration

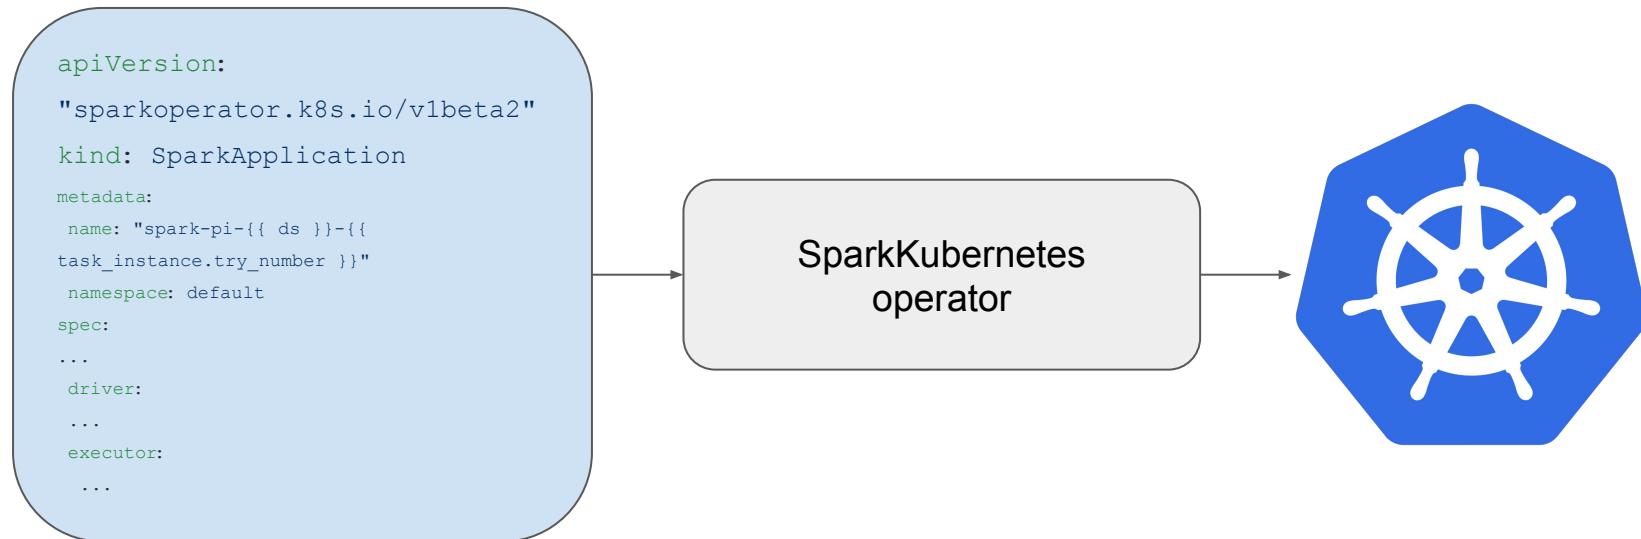

# KubernetesHook

- Gets the **connection parameters** from Airflow's Kubernetes connection
  - E.g kubeconfig, namespace or in-cluster configuration
- Creates an **API client** and allows to create and get a Kubernetes `custom_resource_object`
  - *SparkApplication* is of type *customResource*

# SparkKubernetes operator

- Gets the *SparkApplication* resource definition
- Templates it using Jinja
- Sends it to the Kubernetes cluster

# SparkKubernetes sensor

- Pokes the *SparkApplication* as long as the *applicationState* is SUBMITTED or RUNNING
- Completes successfully if the *applicationState* is SUCCESS, or raises an exception if the *applicationState* is FAILED

# What have we gained by building this integration?

- Official built-in Airflow support

- Security

- Save Kubernetes credentials inside Airflow connection mechanism

- Portability

- Use templated Kubernetes object so the same app can be migrated easily to Airflow and also be run manually

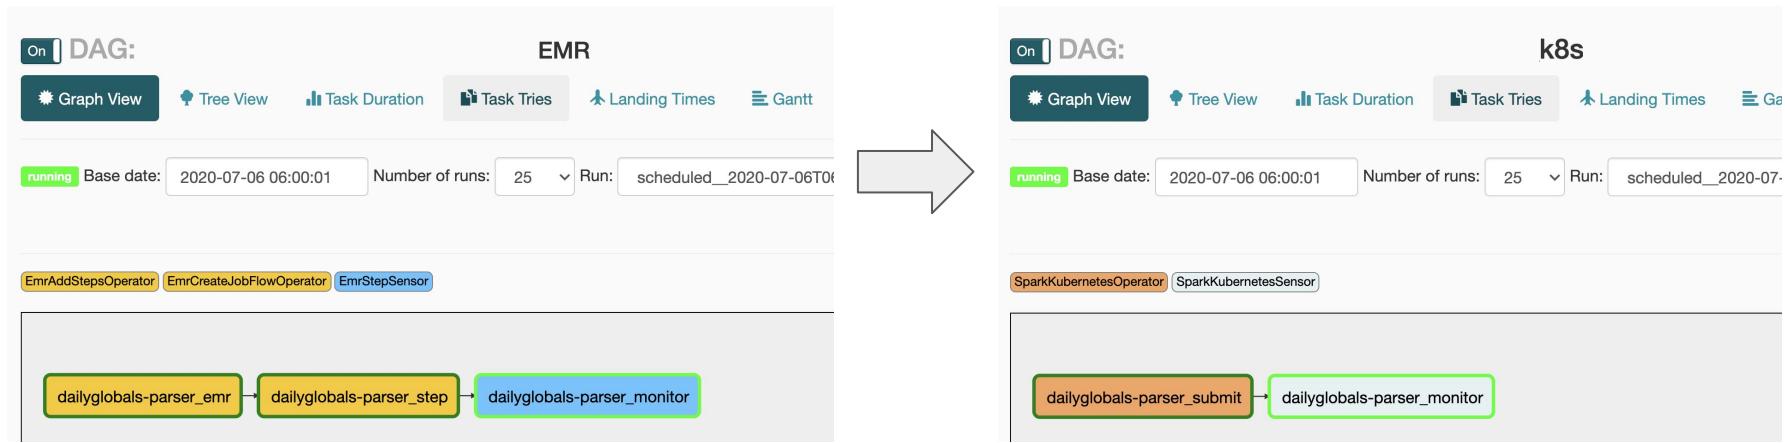

- Kubernetes native

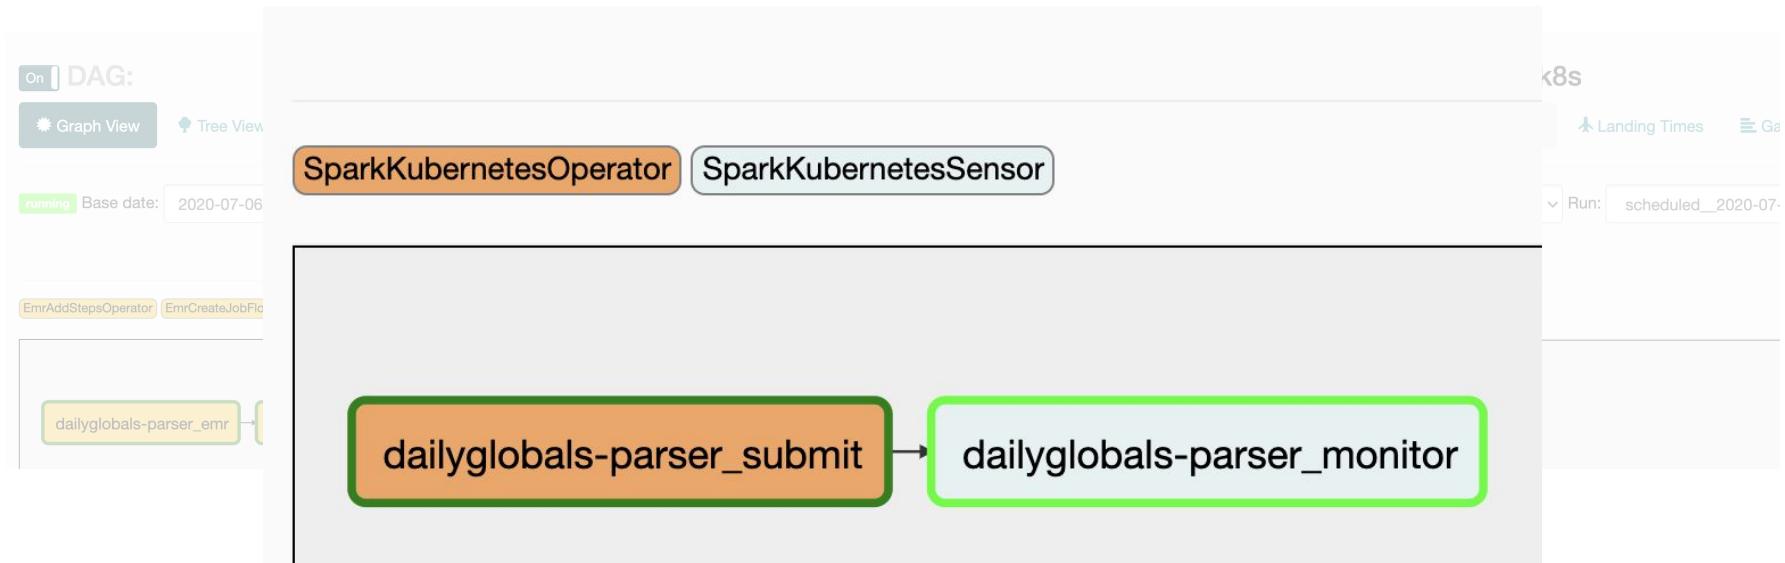

- Communicate directly with the Kubernetes API

# Remember this slide?

# Benefits from migrating to Kubernetes

- **~30% cost reduction**
  - No additional cost per instance
- Better visibility
  - E.g automatic Prometheus configuration using Spark-on-K8s operator
- Robustness
  - E.g running a Spark job on multiple AZs  
(can be beneficial when using Spot instances)

# Current status and future plans

- Airflow integration merged to master
  - Will be available on Airflow 2.0
  - Planned to be included as a backport package on Airflow 1.10.11
- Extend the new KubernetesHook and possibly migrate kubernetes\_pod\_operator to work with it
- We're gradually migrating our DAGs

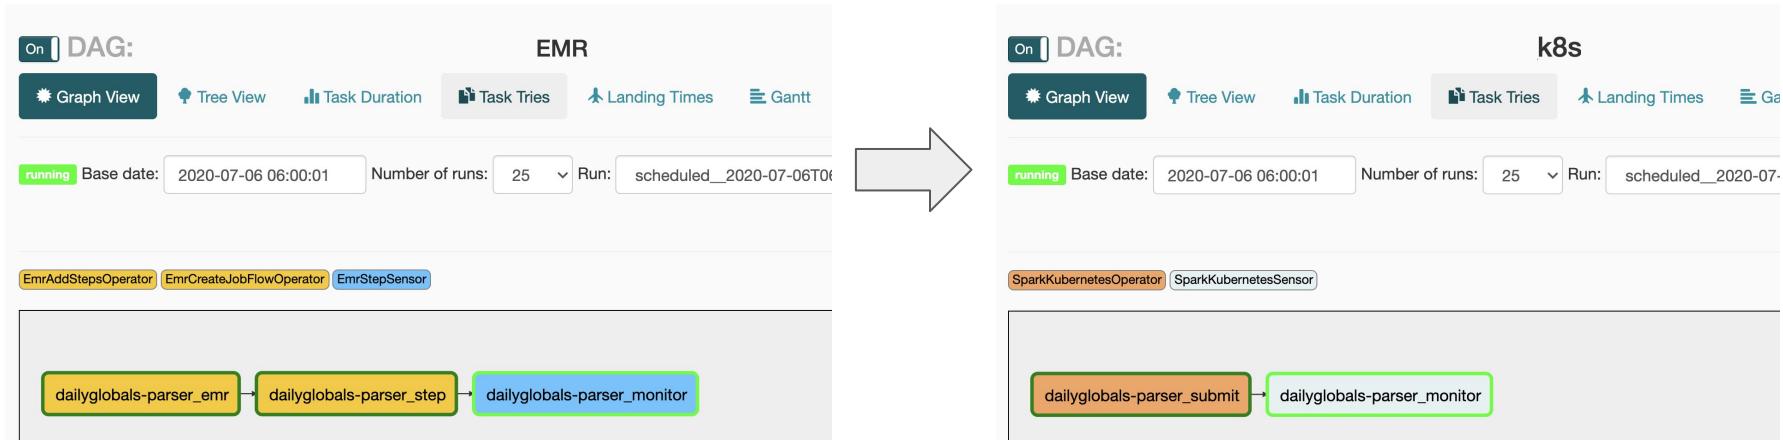

# Airflow “pro” tips

- Use **Jinja templating**
  - Provides the DAG developer with a set of built-in parameters and macros
- Make Airflow more **secured** using K8s' role-based access control (RBAC)

# Airflow “pro” tips

- **Monitoring and alerting**
  - Use the DAG's `on_success_callback` and `on_failure_callback` (in `default_args`) to **emit metrics** to your monitoring system and **trigger alerts** based on those metrics
- Leverage Airflow's **built-in components**  
(Operator/Hook/Sensor)
  - Couldn't find one? Build & **contribute** one 😊

# Same-same...

# ... but different - for you!

**Reduce costs**

**Open your eyes**

**Robust**

- Migrate **your** Spark jobs to Kubernetes
- Leverage the easy-to-use **native Airflow integration** we contributed
